semiconductor component, such as a semiconductor element or the like, is mounted on a circuit substrate. The circuit substrate has external electrodes provided thereon and has an external wiring substrate and an external connector connected thereto. One of the external electrodes of the circuit substrate is connected to the external wiring substrate. The other one of the external electrodes of the circuit substrate is connected to the external connector. This external connector is configured by connecting an external power source to external wiring. The semiconductor component is configured by a base of a semiconductor chip on which various components are mounted and a cap having a sealing resin body (solder resist) attached thereto and formed into a spherical shape. The semiconductor component is hermetically encapsulated with the sealing resin body. The hermetically encapsulated semiconductor component is mounted on the circuit substrate. The base is fixed on the external wiring substrate. The cap is fixed on the external connector. The semiconductor component generates heat. In order to maintain temperature stability of the semiconductor component, therefore, the heat is dissipated from the semiconductor component to the exterior via the external wiring substrate, the external connector, the external wiring and the external power source, as required. In this case, external electrodes are formed on the external wiring substrate, and the external electrodes and the external connector are electrically connected to each other via external wiring. If the external wiring is long, however, heat from the external wiring, which cannot be sufficiently dissipated, is also transmitted to the external connector, and its temperature rises. If the temperature rises, the external wiring and the external connector deteriorate due to temperature increase. In particular, if the heat is transmitted to the external connector through, for example, the external wiring that is difficult to endure the temperature increase, the external connector is more likely to deteriorate./\*\* \*
